REQUIREMENT ANALYSIS

DATA FLOW DIAGRAMS & USER STORIES

Date	5 September 2026
Student Name	Bantupalli Niharika
Project Name	Automated Network Request Management

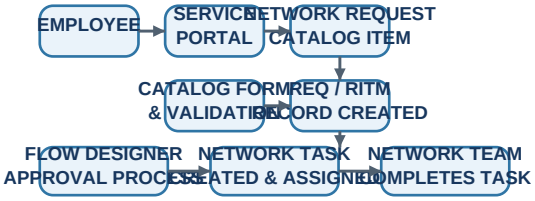
1. Logical Data Flow

The following sequence describes how an employee submits a Network Request and how the request moves through approval and fulfillment in ServiceNow.

Step	Process Description
1	Employee accesses the ServiceNow Service Portal.
2	The employee selects the Network Request catalog item.
3	The system opens the Network Request catalog form.
4	The employee enters the required network request details.
5	Catalog UI Policies control field visibility, while form validations check the entered information.
6	The employee submits the form. ServiceNow creates the request records (REQ/RITM) and stores the submitted details.
7	Flow Designer initiates the approval process and routes the request for approval.
8	After approval, ServiceNow creates a Network Task and assigns it to the Network Fulfillment Team.
9	The Network Fulfillment Team processes the task, completes the requested work, and updates the task status.

2. Data Flow Diagram

Figure 1 presents the high-level flow from employee request submission through approval and network fulfillment.



Flow: Employee → Service Portal → Catalog Item/Form → Validation → REQ/RITM → Approval → Network Task → Network Fulfillment Team → Completion

Figure 1. High-level data flow for the Automated Network Request Management process.

3. User Stories and Acceptance Criteria

User stories describe the needs of each role. Acceptance criteria define the expected result that can be checked during testing.

User Type	User Story	Acceptance Criteria	Priority
Employee	As an employee, I want to find the Network Request catalog item so that I can raise a network service request.	The catalog item is available in the Service Portal to an eligible employee.	High

User Type	User Story	Acceptance Criteria	Priority
Employee	As an employee, I want to enter the required request details so that the Network Team receives the information needed to process my request.	The form displays the required fields; mandatory fields are validated before submission.	High
Employee	As an employee, I want to submit my Network Request so that a request record is created and can be tracked.	A successful submission creates the relevant REQ/RITM record(s), and the request is available in ServiceNow.	High
Approver	As an approver, I want to review and approve a Network Request so that only approved requests proceed to fulfillment.	The request is routed for approval; the approver can review the request and record an approval decision.	High
Network Fulfillment Team	As a Network Team member, I want an approved Network Task assigned to the team so that I can complete the requested network work.	After approval, a Network Task is created and assigned to the Network Fulfillment Team.	High
Administrator	As an administrator, I want to maintain the application configuration so that the request process remains accurate and manageable.	Authorized administrators can access and update the relevant configuration settings.	Medium

4. Process Notes

• Catalog UI Policies are used to control the visibility or behavior of relevant catalog fields.

• Form validation checks that required information is provided before the employee submits the request.

• Flow Designer manages the approval stage. The Network Task is created and assigned after approval, as described in the current workflow.

• The Network Fulfillment Team processes the assigned task and updates it to completion.

Documentation note: The source document does not specify the approval-rejection path, detailed request fields, notification rules, or task closure conditions. These have not been assumed or added as implemented functionality; confirm them against the actual ServiceNow configuration if they are part of the project.
