SOLUTION REQUIREMENTS

Functional and Non-Functional Requirements Specification

Project	Automated Network Request Management System
Student	Bantupalli Niharika
Date	5 September 2026
Platform	ServiceNow

1. Purpose and Scope

This document defines the functional and non-functional requirements for the Automated Network Request Management System developed on the ServiceNow platform. It describes the capabilities expected for capturing, validating, approving, assigning, fulfilling and monitoring network service requests.

The requirements provide a reference for application configuration, implementation, testing and project review. Optional routing, date or SLA behavior should be enabled according to the rules configured for the project.

2. Functional Requirements

FR-01	Application setup	Create a dedicated ServiceNow scoped application for Network Request Management. Configure the required tables, fields, modules and application navigation.
FR-02	Request capture	Capture the requester, request type, location, description and business justification. Where applicable, capture the required start date and end date.
FR-03	Request types	Support New Connection, Bandwidth Upgrade, IP Allocation, VPN Access and Other requests. Present relevant information for the selected request type.
FR-04	Validation	Validate mandatory fields and request information before submission. Apply date checks and attachment validation where those fields or attachments are required.
FR-05	Approvals	Route requests through the appropriate approval process based on request type and location. Support multiple approval levels when required by the configured process.
FR-06	Assignment	Automatically assign approved requests to the appropriate Network Team or group using configured request-type and location-based assignment rules.
FR-07	Fulfillment	Create and track fulfillment tasks for approved requests. Allow assigned teams to update task status and add work notes until the request is completed.
FR-08	Notifications	Send email notifications at key stages, including submission, approval or rejection, assignment, configured status updates and closure.
FR-09	Portal experience	Provide a ServiceNow portal experience with a network request catalog item, a structured request form and request-status tracking for users.
FR-10	Reporting and dashboards	Provide reports and dashboards to monitor request volume, request status, ageing and SLA compliance, where SLA targets are configured.

3. Non-Functional Requirements

Non-functional requirements describe the quality attributes and operational expectations of the application. They complement the functional requirements and guide implementation and testing.

NFR-01	Usability	Provide a clear, consistent and user-friendly interface that enables users to submit and track network requests with minimal confusion.
NFR-02	Security	Use ServiceNow role-based access controls and scoped-application security to ensure users can access only records and actions permitted to their roles.
NFR-03	Reliability	Ensure configured validations, approval flows, assignment rules and notifications execute consistently and handle expected process outcomes.
NFR-04	Performance	Keep request forms, submission actions and routine record operations responsive under the expected project workload.
NFR-05	Availability	Application availability is dependent on the availability and configuration of the underlying ServiceNow instance.
NFR-06	Scalability	Design the application so additional request types, automation rules and Network Teams can be introduced with limited rework.
NFR-07	Maintainability	Organize configuration, workflows and business rules so authorized administrators can review, update and maintain them efficiently.
NFR-08	Data integrity	Maintain accurate request details and consistent status information throughout the request lifecycle. Prevent invalid or incomplete data from being processed.

4. Requirement Acceptance Checks

The solution can be reviewed against the following high-level checks:

• A user can submit a network request using the configured request form.

• The system validates required information before accepting a submission.

• Requests follow the configured approval and assignment rules.

• Fulfillment tasks can be updated and tracked through completion.

• Users receive configured notifications and can view request status in the portal.

• Authorized users can review request information through reports and dashboards.

Note: This specification consolidates and clarifies the requirements shown in the supplied document and its functional-coverage graphic. It describes expected system behavior; it does not by itself confirm that every listed feature has already been implemented.
