PROJECT DEVELOPMENT PHASE

Functional & Performance Testing

TESTING REPORT | AUTOMATED NETWORK REQUEST MANAGEMENT

Date	5 September 2026	**Student Name**	Bantupalli Niharika
Project Name	Automated Network Request Management	**Maximum Marks**	

1. Testing Overview

This report records the functional validation of the Automated Network Request Management application. The scenarios cover portal access, catalog navigation, request entry, mandatory-field validation, submission, approval, task creation and the end-to-end request flow. Performance-testing measurements were not included in the supplied source document.

2. Functional Test Scenarios & Results

Test ID	Test Scenario	Expected Result	Status
TC-01	Access the Service Portal	The Service Portal loads and is accessible.	**Pass**
TC-02	View the Network Request catalog item	The Network Request catalog item is displayed.	**Pass**
TC-03	Open the Network Request form	The request form opens successfully.	**Pass**
TC-04	Enter request details	The required request fields are available for input.	**Pass**
TC-05	Select the device type	Relevant device-type options are displayed.	**Pass**
TC-06	Validate mandatory fields	The form identifies missing mandatory information.	**Pass**
TC-07	Submit a Network Request	A request (REQ) and requested item (RITM) are created.	**Pass**
TC-08	Verify the approval workflow	The submitted request is routed for approval.	**Pass**
TC-09	Create a Network Task	A task is created for the Network Team.	**Pass**
TC-10	Execute end-to-end validation	The complete request workflow operates as expected.	**Pass**

10 / 10	100%	0
Functional scenarios passed	Functional pass rate	Functional failures recorded

3. Performance Testing

Performance testing evaluates how the application behaves under workload. The supplied document does not provide measured performance results; therefore, no response-time, throughput, concurrent-user or resource-utilization values are reported here.

Recommended test	Purpose / measurement	Evidence in supplied report
Load testing	Measure behaviour under expected user traffic and record response time.	Not provided
Stress testing	Assess behaviour beyond expected workload and identify failure limits.	Not provided
Concurrent-user testing	Check simultaneous request submissions and workflow stability.	Not provided
Resource monitoring	Monitor CPU, memory and server-resource usage during execution.	Not provided

4. Observations

- All 10 functional scenarios listed in the source report are marked as Pass.
- The recorded scenarios cover the main Network Request workflow, from portal access through task creation and end-to-end validation.
- The source report does not specify the test environment, test data, execution evidence or performance benchmarks.

5. Recommendations

- Execute load and stress tests with a defined number of concurrent users.
- Record average and peak response times, throughput, error rate, and CPU/memory utilization.
- Retain screenshots or system logs as evidence for each test case.
- Re-test the workflow after changes to forms, approvals or task-assignment rules.

Testing conclusion
Functional testing: 10 of 10 documented scenarios passed. Performance testing: additional execution and measured results are required before performance can be declared successful.

Prepared as a revised project testing report. Results are limited to the information supplied in the original document.
